1. GHL Push from Inventory (People table only)

1a. Clients Table (Supabase)

Create a new clients table in Supabase:

```
CREATE TABLE clients (
  id                    UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  slug                  TEXT UNIQUE NOT NULL,
  name                  TEXT NOT NULL,
  ghl_api_key           TEXT,
  ghl_location_id       TEXT,
  emailbison_api_key    TEXT,
  emailbison_workspace_id TEXT,
  is_active             BOOLEAN DEFAULT true,
  updated_at            TIMESTAMPTZ DEFAULT NOW()
);
```

Populate with all 12 clients. Credentials are in the project .env file — map GHL_<CLIENT>_API_KEY, GHL_<CLIENT>_SUBACCOUNT_ID, EMAILBISON_<CLIENT>_KEY to the right rows.

1b. Platform Pushes Table (Supabase)

```
CREATE TABLE platform_pushes (
  id                UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  person_id         UUID REFERENCES people(id) ON DELETE CASCADE,
```

client_id UUID REFERENCES clients(id),

platform TEXT NOT NULL,

platform_contact_id TEXT,

campaign_tag TEXT,

pushed_at TIMESTAMPTZ DEFAULT NOW(),

UNIQUE(person_id, client_id, platform)

);

1c. Clients Management Page in Interface

Add a Clients page to the interface. Simple table of all clients with inline-editable credential fields. Saving updates the clients table in Supabase. This is how we switch sub-account IDs or API keys for any client without touching code.

1d. Push to GHL Flow

Trigger: User is on the People page with filters applied. They click "Push to GHL."

Step 1 — Select client. Dropdown populated from clients table (is_active = true).

Step 2 — Fetch GHL custom fields for that sub-account.

GET https://services.leadconnectorhq.com/locations/{locationId}/customFields

Authorization: Bearer {ghl_api_key}

Version: 2021-07-28

Cache per sub-account per session. Do not call per contact.

Step 3 — Custom field mapping (if virtual enrichment columns are active). Show mapping UI: "Your enrichment field → GHL custom field." User maps or skips each one.

Step 4 — Push contacts. For each person in the filtered list:

Build the structured tag:

{Client Name} - {Niche} | {employee_range} | {country} | {data_source}

- Employee ranges: 1–10, 11–50, 51–200, 201–500, 500+
- Country from companies.country

- Data source from companies.source — use as-is (comma-separated if multi-source)

POST to GHL:

POST https://services.leadconnectorhq.com/contacts/

Authorization: Bearer {ghl_api_key}

Version: 2021-07-28

```
{
  "locationId": "{ghl_location_id}",
  "firstName": "...",
  "lastName": "...",
  "email": "...",
  "phone": "...",
  "companyName": "...",
  "city": "...",
  "country": "...",
  "tags": ["{structured_tag}"],
  "customField": [{"id": "{field_id}", "value": "..."}]
}
```

Duplicate handling: If GHL returns 400 with meta.contactId, treat as soft success. Append the tag to the existing contact:

POST /contacts/{contactId}/tags

{"tags": ["{structured_tag}"]}

Rate limit: 200ms between calls.

Step 5 — Write back to Supabase.

INSERT INTO platform_pushes (person_id, client_id, platform, platform_contact_id, campaign_tag, pushed_at)

VALUES (...)

ON CONFLICT (person_id, client_id, platform) DO UPDATE

SET platform_contact_id = EXCLUDED.platform_contact_id,

  campaign_tag = EXCLUDED.campaign_tag,

  pushed_at = EXCLUDED.pushed_at;

Also update people.pushed_to_ghl = true and pushed_to_ghl_at = NOW().

Step 6 — Push summary.

Sub-account: Kynship

Total selected: 1,200

Created (new): 980

Tag-appended: 214

Failed: 6

Default filter: Only push phone_type IN ('mobile', 'toll_free'). Skip landlines.

---

2. EmailBison Push from Inventory (Companies table + People table)

Follow the exact same pattern as Clay's native EmailBison integration. Clay has two built-in enrichments: one to add a lead to an EmailBison workspace, one to add them to a campaign. Saqlain will walk you through how those work on the call. Replicate the same API calls in the inventory interface.

Credentials come from the clients table (emailbison_api_key, emailbison_workspace_id).

Variable names: EmailBison custom variables do not require fetching IDs. Just pass the variable name exactly as it appears in the EmailBison workspace.

Duplicate handling: If EmailBison returns 422 "already taken" on an email, treat as soft success and continue.

Write back to platform_pushes same as GHL, with platform = 'emailbison'.

Placement: Add the Push to EmailBison button to both the Companies table and the People table.

---

3. Custom Data Filtration (Virtual Columns)

Enrichment fields live in custom_data JSONB and are different for every campaign. The solution is virtual columns — they exist only in the interface, not in the database schema.

How it works

Adding a virtual column:

1. User clicks "Add column from enrichment" on the Companies or People table.
2. Interface fetches all distinct keys in custom_data across the current filtered result set:

```
SELECT DISTINCT jsonb_object_keys(custom_data)

FROM people

WHERE [current filters]

ORDER BY 1;
```

1. User picks a key (e.g. lead_score) and selects its type: Text / Number / Boolean.
2. Column appears in the table reading custom_data->>'lead_score' per row.
3. Filter controls appear based on type:
   - **Number:** is / is not / greater than / less than / between
   - **Text:** is / is not / do not contain / contains / is empty / is not empty
   - **Boolean:** is true / is false

Backend filter queries:

```
-- Number between

WHERE (custom_data->>'lead_score')::numeric BETWEEN 90 AND 100

-- Text equals

WHERE custom_data->>'ecom_qualification' = 'qualified'

-- Text contains

WHERE custom_data->>'ecom_qualification' ILIKE '%qualified%'

-- Is not empty

WHERE custom_data->>'lead_score' IS NOT NULL
```

```
  AND custom_data->>'lead_score' != ''

-- Key exists

WHERE custom_data ? 'lead_score'
```

Column state is frontend-only. Nothing is written to the Supabase schema. custom_data JSONB is never modified by this feature.

After push or export: Interface prompts: "You used these temporary columns: lead_score, ecom_qualification. Remove them from view?" User selects which to remove. They disappear from the table. Underlying data in custom_data is untouched.

Virtual columns + GHL mapping: If virtual columns are active when the user initiates a GHL push, the custom field mapping step picks them up automatically and offers to map them to GHL custom fields.

---

4. Speed Optimization

Audit and optimize the full interface for speed. Focus areas: query efficiency, indexes, pagination, unnecessary re-fetches on filter change, large payload sizes. Estimated time: 1 day.

---

5. UI Fixes

5a. Filter dropdown scrolling bug. On Companies and People pages, scrolling while a filter dropdown is open scrolls the main results list instead of the options within the dropdown. Fix: give the dropdown options list its own scroll container with overflow-y: auto and a fixed max-height. Lock main page scroll while a dropdown is open.

5b. Remove "Re-verify Phone" from Companies table only. Remove the Re-verify Phone button from the Companies table. Keep Re-verify Email on the Companies table. Keep both buttons on the People table.

5c. Add Job Title column to People table. In the People list view, add a Job Title column immediately after Full Name. Field is job_title on the people table — already in the database, just needs mapping into the list view.
